Add a new language to system settings

Version: 10.2

Add a language to system settings [↗](#)

Before you can create a version of an item in a new language, you must add the new language in the Experience Manager system settings. Then the new language code and associated country/region code become available for configuration within Sitecore.

To add a language to system settings:

1. In the Content Editor, go to */sitecore/System/Languages*.
2. Right-click and then click **Insert, Language**.
3. In the **Add a New Language** dialog box, in the **Choose a predefined language code** field, select the language and country code you want to use.
4. Complete the remaining fields as required and click **Next** to step through the remaining pages of the wizard.

Add a New Language

×

Choose a predefined language code or enter a language identifier and a country/region code for the new language.

Choose a predefined language code:

Spanish (Spain, International Sort) : español (España, alfabetización internac

▼

The language code consists of a language identifier, for example, "en" for English and a country/region code, for example, "US" for United States. The language code is then "en-US".

Language:

es

E.g. "en"

Country/region code:

ES

E.g. "US"

Custom code:

Next

Cancel

- When you are finished, click **Close**.

The new language is added to the content tree.

Add a custom language [↗](#)

The system supports all the languages available in the .NET `CultureInfo` class. If you want to add a language that is not available in the default cultures, you first register a

When you add a new language in Sitecore system settings, the languages available in the drop-down menu of the **Add a New Language** dialog are determined by the list of languages in the `LanguageDefinitions.config` file. However, you also have the option of typing in the language manually in the system settings.

1. Register a custom .NET culture by creating a simple console application, as explained in [Microsoft documentation](#).
2. Run the application once on each Sitecore environment server.
3. Open the language config file under `\App_Config\LanguageDefinitions.config`.
4. Add the language in the following format. The language definition must match the .NET custom culture.

Copy

```
<language id="pt" region="MX" codepage="65001" encoding="utf-8"
charset="iso-XXXX" icon="flags/16x16/flag_Mexic.PNG" />
```

5. In the Content Editor, go to `/sitecore/System/Languages`.
6. Right-click and then click **Insert, Language**.
7. If you added the language to the config file, in the **Add a New Language** dialog box, in the **Choose a predefined language code** field, select the language and country code you want to use. Alternatively, type the language code manually. In both cases, the language code must match the registered custom culture.
8. Complete the remaining fields as required and click **Next** to step through the remaining pages of the wizard.
9. When you are finished, click **Close**. The new language is added to the content tree.
