Tag content using Sitecore Content Tagging

Version: 10.2

Sitecore Content Tagging offers an easy and accurate way to tag the people, places, products, companies, facts, and events that are mentioned in your content. This increases the value, accessibility, and interoperability of your content. The Sitecore Content Tagging feature integrates the Sitecore CMS with machine learning (ML) based natural language processing (NLP) engines like Refinitiv Intelligent Tagging Open Calais. This enables Sitecore to send content to an NLP platform. The NLP engine processes the content and returns semantic metadata to Sitecore. Sitecore uses the metadata to tag content with user-defined taxonomy.

If you have permission to edit an item, and if an [administrator has configured content tagging](#) for your solution, you can run the content tagging process on the item in either the Content Editor or the Experience Editor. However, you can only see the results in the Content Editor.

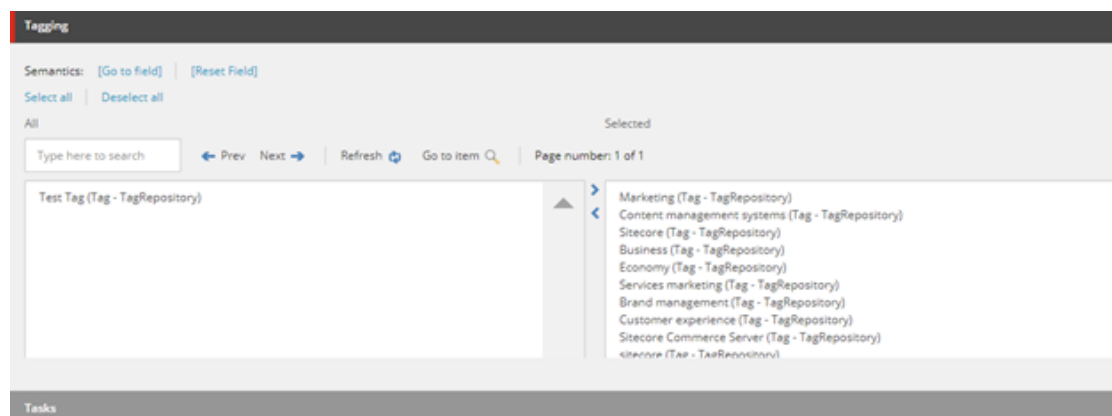

To tag content using Sitecore Content Tagging, in the Experience Editor or the Content Editor:

- Navigate to the item that you want to tag. On the **Home** ribbon, in the **Content Tagging** group, do one of the following:

- To tag the current item and its subitems, in the Content Editor, click the **Tag item** drop-down arrow, and then click **Tag item and subitems**.

Sitecore displays a message window with a progress indicator while content tagging is in process. When the message window closes, the process is complete and you can verify that tags have been added to the item.

- To verify that tags have been added to the item, select the item in the Content Editor. In the **Tagging** section, check that the **Semantics** field contains tags.

Note

The **Semantics** field is a standard field, so it will only be visible if **Standard fields** is selected on the **View** tab.
